SPECIFICATION & BLUEPRINT DOCUMENT

System Architecture Overview

PART 1

1. System Structure

The core structure provides the foundational framework and organizational hierarchy. It defines how data flows between system components, manages state boundaries, and enforces separation of concerns across all operational layers.

Layer	Component Name	Primary Responsibility
Presentation Layer	User Interface / Layout Engine	Handles rendering, routing, and user interaction logic.
Logic Layer	Business Logic Core	Processes rules, data transformations, and state updates.
Data Layer	Persistence & Storage Gateway	Manages API calls, caching, and database transactions.

> **Structural Note:** The top-level structure maintains modular independence, ensuring that structural alterations do not disrupt downstream module execution.

PART 2

2. Functional Modules

The system is composed of specialized modules designed to execute dedicated workloads. Each module operates as an independent, testable unit that interfaces cleanly with the core structure.

Module ID	Module Title	Type	Status
MOD-01	Authentication Module	Security & Access	Active
MOD-02	Data Processing Module	Core Engine	Active
MOD-03	Reporting & Analytics	Output / Export	In Progress
MOD-04	Integration Module	External API	Planned
